

FC Barcelona Fan Web Application

Project Report - Frontend ReactJS Phase

Student Name: Ibrahim Abdulkader

Course: CSC1390 Web Programming

Date: 25/5/2026

Abstract

This project is a responsive frontend web application built with ReactJS. The application organizes football club information into clear pages such as Home, About, Team, Matches, Gallery, and Contact. It improves the previous static HTML/CSS website by using reusable React components, state-based page navigation, a responsive layout, and a cleaner project structure ready for GitHub and deployment.

Problem Statement

Football fans often need one simple place to view club information, squad members, upcoming matches, gallery photos, and contact details. This web application solves that by creating an organized fan hub with useful navigation and a modern interface.

System Design

The app is designed as a frontend-only React application. The main App component controls navigation using React state. Each page is separated into its own component inside the pages folder. Images and visual assets are stored inside the assets folder. The CSS file controls the layout, responsive behavior, cards, table, gallery, and form styling.

Technologies Used

ReactJS for building components, Vite for development and build tools, CSS3 for styling and responsive design, HTML5 through the React root template, Git for version control, and Vercel/Netlify/GitHub Pages for hosting.

Main Features

The project includes more than four pages, responsive design, interactive navigation, player cards, a matches table, image gallery, contact form feedback, and reusable frontend structure. It combines the old club website content with the new ReactJS requirements.

Code Snippets

```
function App () {
  const [page, setPage] = useState("home");
  const pages = {home: <Home />, about: <About />, team: <Team />};
  return <main>{pages[page]} </main>;}

const players = [ {name: "Lewandowski", position: "Striker", img:
Lewandowski},
  {name: "Pedri", position: "Midfielder", img: Pedri},
  {name: "Gavi", position: "Midfielder", img: Gavi}
];
```

Deployment Instructions

Run npm install, then npm run dev to test locally. Commit the project to GitHub with clear commits, then deploy using Vercel, Netlify, or GitHub Pages. Add screenshots to the README file after testing the UI.
